- **Explanation of information provided:**

- Symptomatic – Either prior to being tested and/or during the case investigation, individual reports having symptoms. Not Symptomatic – Individual reports no symptoms to date. We continue to monitor each case throughout their quarantine/isolation period for developing symptoms.
- During the case investigation, we work with the individual to determine the most possible origin of their exposure. In some instances, they can be linked to another positive case and/or a location where positive cases were identified. Some cases have no known linkage to another positive case and/or exposure location.
- During the case investigation we work with the individual to determine locations they potentially could be exposing others, especially large groups. Individuals under quarantine/isolation for a previous exposure to a positive case should have limited or no public exposure.

Symptoms of COVID-19 illness may include: fever, cough, shortness of breath/difficulty breathing, chills, muscle pain, headache, sore throat, new loss of taste or smell. Anyone with concerns are advised to contact their healthcare provider for further directions. Protection for yourself and others include: proper/frequent handwashing, cleaning frequently used surfaces, staying at home when you are sick, avoiding contact with people who are sick, coughing/sneezing into tissues, wearing a mask when in public, not gathering in large groups, and maintaining a six (6) foot distance between yourself and another person.

It should be understood that with the current community illness spread, any public activity should be considered a potential exposure risk, and all precautions need to be taken for your personal protection.
